Cumulant Green's function methods for molecules

Pierre-François Loos, ^{a)} Antoine Marie, ^{b)} and Abdallah Ammar^{c)}
Laboratoire de Chimie et Physique Quantiques (UMR 5626), Université de Toulouse, CNRS, UPS, France

This document contains a detailed derivation of the cumulant expansion. Notations are defined in the main manuscript.

I. RETARDED ONE-BODY GREEN'S FUNCTION

The matrix elements of the Hartree-Fock (HF) retarded Green's function in the time domain are

$$G_{pq}^{HF}(t) = -\mathrm{i}\,\Theta(t)\,e^{-\mathrm{i}\epsilon_p^{HF}t}\,\delta_{pq} \tag{1}$$

Thanks to the following definition of the Heaviside step function

$$\Theta(t) = -\frac{1}{2\pi i} \int_{-\infty}^{\infty} d\omega \frac{e^{-i\omega t}}{\omega + i\eta}$$
 (2)

one can compute the Fourier transform of Eq. (1) and obtain the expression of the matrix elements in the frequency domain

$$G_{pq}^{HF}(\omega) = \int dt \, e^{i\omega t} \, G_{pr}^{HF}(t)$$

$$= -i \, \delta_{pq} \, \int_{-\infty}^{\infty} dt \, e^{i(\omega - \epsilon_{p}^{HF})t} \, \Theta(t)$$

$$= -i \, \delta_{pq} \, \int_{-\infty}^{\infty} dt \, e^{i(\omega - \epsilon_{p}^{HF})t} \left[-\frac{1}{2\pi i} \int_{-\infty}^{\infty} d\omega' \frac{e^{-i\omega' t}}{\omega' + i\eta} \right]$$

$$= \frac{1}{2\pi} \, \delta_{pq} \, \int_{-\infty}^{\infty} d\omega' \frac{1}{\omega' + i\eta} \, \int_{-\infty}^{\infty} dt \, e^{i(\omega - \omega' - \epsilon_{p}^{HF})t}$$

$$= \frac{1}{2\pi} \, \delta_{pq} \, \int_{-\infty}^{\infty} d\omega' \frac{1}{\omega' + i\eta} \, (2\pi) \, \delta(\omega - \omega' - \epsilon_{p}^{HF})$$

$$= \frac{\delta_{pq}}{\omega - (\epsilon_{p}^{HF} - i\eta)}.$$
(3)

II. CUMULANT

The general definition of the cumulant, obtained by equating the first-order term in W (refer to the manuscript), is expressed as

$$G^{HF}(t)C(t) = \iint dt_1 dt_2 G^{HF}(t - t_1) \Sigma^{c}(t_1 - t_2) G^{HF}(t_2)$$
(4)

Projecting this equation in the spinorbital basis yields

$$\sum_{r} G_{pr}^{HF}(t) C_{rq}(t) = \sum_{rs} \iint dt_{1} dt_{2} G_{pr}^{HF}(t-t_{1}) \Sigma_{rs}^{c}(t_{1}-t_{2}) G_{sq}^{HF}(t_{2})$$

$$\Rightarrow -i \sum_{r} \Theta(t) e^{-i\epsilon_{p}^{HF}t} \delta_{pr} C_{rq}(t) = \sum_{rs} \iint dt_{1} dt_{2} G_{pr}^{HF}(t-t_{1}) \Sigma_{rs}^{c}(t_{1}-t_{2}) G_{sq}^{HF}(t_{2})$$

$$\Rightarrow -i \Theta(t) e^{-i\epsilon_{p}^{HF}t} C_{pq}(t) = \sum_{rs} \iint dt_{1} dt_{2} G_{pr}^{HF}(t-t_{1}) \Sigma_{rs}^{c}(t_{1}-t_{2}) G_{sq}^{HF}(t_{2})$$

$$\Rightarrow \Theta(t) C_{pq}(t) = i e^{i\epsilon_{p}^{HF}t} \sum_{rs} \iint dt_{1} dt_{2} G_{pr}^{HF}(t-t_{1}) \Sigma_{rs}^{c}(t_{1}-t_{2}) G_{sq}^{HF}(t_{2})$$

$$(5)$$

b) Electronic mail: amarie@irsamc.ups-tlse.fr

c) Electronic mail: aammar@irsamc.ups-tlse.fr

Assuming t to be positive, we obtain

$$C_{pq}(t) = i \int \frac{d\omega}{2\pi} e^{-i(\omega - \epsilon_p^{HF})t} G_{pp}^{HF}(\omega) \Sigma_{pq}^{c}(\omega) G_{qq}^{HF}(\omega)$$
(6)

Using the diagonal approximation $\Sigma_{pq}(\omega) \approx \delta_{pq}\Sigma_{pp}(\omega)$ leads to

$$C_{pq}(t) = i \,\delta_{pq} \int \frac{d\omega}{2\pi} \, e^{-i(\omega - \epsilon_p^{HF})t} \left[G_{pp}^{HF}(\omega) \right]^2 \Sigma_{pp}^{c}(\omega)$$

$$= i \,\delta_{pq} \int \frac{d\omega}{2\pi} \, e^{-i(\omega - \epsilon_p^{HF})t} \,\Sigma_{pp}^{c}(\omega) \left[\frac{1}{\omega - \left(\epsilon_p^{HF} - i\eta \right)} \right]^2$$

$$= i \,\delta_{pq} \int \frac{d\omega}{2\pi} \, e^{-i\omega t} \, \frac{\Sigma_{pp}^{c}(\omega + \epsilon_p^{HF})}{\left[\omega - (0 - i\eta) \right]^2}$$
(7)

Inserting the frequency expression of the self-energy

$$\Sigma_{pp}^{c}\left(\omega + \epsilon_{p}^{HF}\right) = \sum_{iv} \frac{M_{piv}^{2}}{\omega - \Delta_{piv}} + \sum_{av} \frac{M_{pav}^{2}}{\omega - \Delta_{pav}}$$

$$\tag{8}$$

with

$$\Delta_{piv} = \epsilon_i - \epsilon_p^{HF} - \Omega_v - i\eta \qquad \qquad \Delta_{pav} = \epsilon_a - \epsilon_p^{HF} + \Omega_v - i\eta \qquad (9)$$

we obtain

$$C_{pp}(t) = i \sum_{iv} M_{piv}^2 \int \frac{d\omega}{2\pi} e^{-i\omega t} \frac{1}{\left[\omega - (0 - i\eta)\right]^2} \frac{1}{\omega - \Delta_{piv}} + i \sum_{av} M_{pav}^2 \int \frac{d\omega}{2\pi} e^{-i\omega t} \frac{1}{\left[\omega - (0 - i\eta)\right]^2} \frac{1}{\omega - \Delta_{pav}}.$$

$$(10)$$

Applying the residue theorem on the following integral [where $\text{Im}(\omega_1)$, $\text{Im}(\omega_2) < 0$] leads to

$$\int \frac{d\omega}{2\pi} e^{-i\omega t} \frac{1}{(\omega - \omega_1)^2} \frac{1}{\omega - \omega_2} = (-i) \left\{ \left[\partial_\omega \left(\frac{e^{-i\omega t}}{\omega - \omega_2} \right) \right]_{\omega = \omega_1} + \left[\frac{e^{-i\omega t}}{(\omega - \omega_1)^2} \right]_{\omega = \omega_2} \right\}$$

$$= \frac{(-i)}{(\omega_1 - \omega_2)^2} \left\{ \left[(-it)(\omega_1 - \omega_2) - 1 \right] e^{-i\omega_1 t} + e^{-i\omega_2 t} \right\},$$
(11)

we find

$$\int \frac{\mathrm{d}\omega}{2\pi} \, e^{-\mathrm{i}\omega t} \, \frac{1}{\left[\omega - (0 - \mathrm{i}\eta)\right]^2} \, \frac{1}{\omega - \Delta_{piv}} = \frac{-\mathrm{i}}{\Delta_{piv}^2} \left(e^{-\mathrm{i}\Delta_{piv}t} + \mathrm{i}\Delta_{piv}t - 1 \right) \tag{12}$$

and

$$\int \frac{\mathrm{d}\omega}{2\pi} e^{-\mathrm{i}\omega t} \frac{1}{\left[\omega - (0 - \mathrm{i}\eta)\right]^2} \frac{1}{\omega - \Delta_{pav}} = \frac{-\mathrm{i}}{\Delta_{pav}^2} \left(e^{-\mathrm{i}\Delta_{pav}t} + \mathrm{i}\Delta_{pav}t - 1 \right). \tag{13}$$

Therefore, the diagonal elements of the cumulant are given by the following expression

$$C_{pp}(t) = \sum_{iv} \frac{M_{piv}^2}{\Delta_{piv}^2} \left(e^{-i\Delta_{piv}t} + i\Delta_{piv}t - 1 \right) + \sum_{av} \frac{M_{pav}^2}{\Delta_{pav}^2} \left(e^{-i\Delta_{pav}t} + i\Delta_{pav}t - 1 \right)$$

$$= \sum_{iv} \zeta_{piv} \left(e^{-i\Delta_{piv}t} + i\Delta_{piv}t - 1 \right) + \sum_{av} \zeta_{pav} \left(e^{-i\Delta_{pav}t} + i\Delta_{pav}t - 1 \right),$$
(14)

where we have introduced the following intermediate quantities:

$$\zeta_{piv} = \left(\frac{M_{piv}}{\Delta_{piv}}\right)^2, \qquad \qquad \zeta_{pav} = \left(\frac{M_{pav}}{\Delta_{pav}}\right)^2. \tag{15}$$

III. LANDAU FORM

In this section, we derive the Landau form of the cumulant. The first step is to derive the spectral representation of the self-energy

$$\begin{split} \Sigma_{pp}^{c}(\omega) &= \text{Re}[\Sigma_{pp}^{c}(\omega)] + i \operatorname{Im}[\Sigma_{pp}^{c}(\omega)] \\ &= \frac{1}{\pi} \mathcal{P} \int d\omega' \frac{\operatorname{Im}[\Sigma_{pp}^{c}(\omega')]}{\omega' - \omega} + i \int d\omega' \operatorname{Im}[\Sigma_{pp}^{c}(\omega')] \delta(\omega' - \omega) \\ &= \frac{1}{\pi} \int d\omega' \frac{\operatorname{Im}[\Sigma_{pp}^{c}(\omega')]}{\omega' - \omega - i\eta} = \int d\omega' \frac{\beta_{p}(\omega')}{\omega - \omega' + i\eta}. \end{split} \tag{16}$$

To obtain this expression, we first used the Kramers-Kronig relation, then the identity

$$\frac{1}{x \pm i\eta} = \mathcal{P}\left(\frac{1}{x}\right) \mp i\pi \,\delta(x),\tag{17}$$

and finally we introduced

$$\beta_p(\omega) = -\frac{1}{\pi} \operatorname{Im} \Sigma_{pp}^{c}(\omega) \tag{18}$$

This expression of the self-energy is now inserted into the cumulant

$$C_{pq}(t) = i \, \delta_{pq} \int \frac{d\omega}{2\pi} \, e^{-i\omega t} \frac{\sum_{pp}^{c} \left(\omega + \epsilon_{p}^{HF}\right)}{\left[\omega - (0 - i\eta)\right]^{2}}$$

$$= i \, \delta_{pq} \int \frac{d\omega}{2\pi} \, \frac{e^{-i\omega t}}{\left[\omega - (0 - i\eta)\right]^{2}} \int d\omega' \, \frac{\beta_{p}(\omega')}{\omega + \epsilon_{p}^{HF} - \omega' + i\eta}$$

$$= \frac{i \, \delta_{pq}}{2\pi} \int d\omega' \, \beta_{p}(\omega') \int d\omega \, \frac{e^{-i\omega t}}{\left[\omega - (0 - i\eta)\right]^{2} \left[\omega - \left(\omega' - \epsilon_{p}^{HF} - i\eta\right)\right]}$$

$$= \frac{i \, \delta_{pq} \left(-2\pi i\right)}{2\pi} \int d\omega' \, \beta_{p}(\omega') \left[\partial_{\omega} \left\{\frac{e^{-i\omega t}}{\left[\omega - \left(\omega' - \epsilon_{p}^{HF} - i\eta\right)\right]}\right\}_{\omega = -i\eta} + \left(\frac{e^{-i\omega t}}{\left(\omega + i\eta\right)^{2}}\right)_{\omega = \omega' - \epsilon_{p}^{HF} - i\eta}\right]$$

$$= \delta_{pq} \int d\omega' \, \beta_{p}(\omega') \left[\frac{it\left(\omega' - \epsilon_{p}^{HF}\right) - 1}{\left(\omega' - \epsilon_{p}^{HF}\right)^{2}} + \frac{e^{-i\left(\omega' - \epsilon_{p}^{HF} - i\eta\right)t}}{\left(\omega' - \epsilon_{p}^{HF}\right)^{2}}\right]$$

$$= \delta_{pq} \int d\omega \, \frac{\beta_{p}(\omega + \epsilon_{p}^{HF})}{\omega^{2}} \left(e^{-i\omega t} + i\omega t - 1\right).$$
(19)

which yields the so-called Landau form of the cumulant.

IV. GW+C PROPAGATOR

The GW+C ansatz in the time domain reads

$$G_{pp}(t) = G_{pp}^{HF}(t) \exp\left[C_{pp}(t)\right]$$

$$= -i\Theta(t) \exp\left[-i\epsilon_{p}^{HF}t + C_{pp}(t)\right]$$

$$= -i\Theta(t) \exp\left[-i\epsilon_{p}^{HF}t + \sum_{i\nu} \zeta_{pi\nu} \left(e^{-i\Delta_{pi\nu}t} + i\Delta_{pi\nu}t - 1\right) + \sum_{a\nu} \zeta_{pa\nu} \left(e^{-i\Delta_{pa\nu}t} + i\Delta_{pa\nu}t - 1\right)\right]$$

$$= -i\Theta(t) Z_{p}^{QP} \exp\left(-i\epsilon_{p}^{QP}t\right) \exp\left(\sum_{i\nu} \zeta_{pi\nu} e^{-i\Delta_{pi\nu}t} + \sum_{a\nu} \zeta_{pa\nu} e^{-i\Delta_{pa\nu}t}\right)$$
(20)

where the weight of the quasiparticle peak is

$$Z_p^{\text{QP}} = \exp\left(-\sum_{i\nu} \zeta_{pi\nu} - \sum_{a\nu} \zeta_{pa\nu}\right) \tag{21}$$

and the quasiparticle energy is given by

$$\epsilon_p^{\rm QP} = \epsilon_p^{\rm HF} - \left(\sum_{iv} \zeta_{piv} \, \Delta_{piv} + \sum_{av} \zeta_{pav} \, \Delta_{pav} \right) \tag{22}$$

Expanding up to first order and applying the Fourier transform leads to

$$G_{pp}(\omega) = \int_{-\infty}^{+\infty} dt \, e^{i\omega t} \, G_{pp}(t)$$

$$= -i \, Z_{p}^{\text{QP}} \int_{0}^{+\infty} dt \, e^{i\left(\omega - \epsilon_{p}^{\text{QP}}\right)t} \, \exp\left(\sum_{i\nu} \zeta_{pi\nu} \, e^{-i\Delta_{pi\nu}t} + \sum_{a\nu} \zeta_{pa\nu} \, e^{-i\Delta_{pa\nu}t}\right)$$

$$\approx -i \, Z_{p}^{\text{QP}} \int_{0}^{+\infty} dt \, e^{i\left(\omega - \epsilon_{p}^{\text{QP}}\right)t} \left(1 + \sum_{i\nu} \zeta_{pi\nu} \, e^{-i\Delta_{pi\nu}t} + \sum_{a\nu} \zeta_{pa\nu} \, e^{-i\Delta_{pa\nu}t}\right)$$

$$= -i \, Z_{p}^{\text{QP}} \int_{0}^{+\infty} dt \, e^{\left[-\eta + i\left(\omega - \epsilon_{p}^{\text{QP}}\right)\right]t}$$

$$- i \, Z_{p}^{\text{QP}} \sum_{i\nu} \zeta_{pi\nu} \int_{0}^{+\infty} dt \, e^{\left[-\eta + i\left[\omega - \left(\epsilon_{p}^{\text{QP}} + \Delta_{pi\nu}\right)\right]\right]t} - i \, Z_{p}^{\text{QP}} \sum_{a\nu} \zeta_{pa\nu} \int_{0}^{+\infty} dt \, e^{\left[-\eta + i\left[\omega - \left(\epsilon_{p}^{\text{QP}} + \Delta_{pa\nu}\right)\right]\right]t}$$

$$= \frac{Z_{p}^{\text{QP}}}{\omega - \epsilon_{p}^{\text{QP}} + i\eta} + \sum_{i\nu} \frac{Z_{pi\nu}^{\text{sat}}}{\omega - \epsilon_{pi\nu}^{\text{sat}} + i\eta} + \sum_{a\nu} \frac{Z_{pa\nu}^{\text{sat}}}{\omega - \epsilon_{pa\nu}^{\text{sat}} + i\eta}$$
(23)

where we have introduced two sets of satellites at energies

$$\epsilon_{piv}^{\text{sat}} = \epsilon_p^{\text{QP}} + \Delta_{piv}, \qquad \epsilon_{pav}^{\text{sat}} = \epsilon_p^{\text{QP}} + \Delta_{pav}, \qquad (24)$$

with the respective weights

$$Z_{piv}^{\text{sat}} = Z_p^{\text{QP}} \zeta_{piv}, \qquad Z_{pav}^{\text{sat}} = Z_p^{\text{QP}} \zeta_{pav}. \tag{25}$$

V. SPECTRAL FUNCTION

The diagonal elements of the spectral function are obtained as

$$\begin{split} A_{pp}^{GW+C}(\omega) &= -\frac{1}{\pi} \operatorname{Im} G_{pp}(\omega) \\ &= -\frac{1}{\pi} \operatorname{Im} \left[\frac{Z_{p}^{QP}}{\omega - \epsilon_{p}^{QP} + \mathrm{i} \eta} + \sum_{qv} \frac{Z_{pqv}^{\mathrm{sat}}}{\omega - \epsilon_{pqv}^{\mathrm{sat}} + \mathrm{i} \eta} \right] \\ &= -\frac{1}{\pi} \operatorname{Im} \left[\frac{\operatorname{Re} Z_{p}^{QP} + \mathrm{i} \operatorname{Im} Z_{p}^{QP}}{\omega - \operatorname{Re} \epsilon_{pqv}^{QP} + \mathrm{i} \left(\eta - \operatorname{Im} \epsilon_{pqv}^{QP} \right)} + \sum_{qv} \frac{\operatorname{Re} Z_{pqv}^{\mathrm{sat}} + \mathrm{i} \operatorname{Im} Z_{pqv}^{\mathrm{sat}}}{\omega - \operatorname{Re} \epsilon_{pqv}^{\mathrm{sat}} + \mathrm{i} \left(\eta - \operatorname{Im} \epsilon_{pqv}^{\mathrm{sat}} \right)} \right] \\ &= -\frac{1}{\pi} \operatorname{Im} \left[\frac{\left(\operatorname{Re} Z_{p}^{QP} + \mathrm{i} \operatorname{Im} Z_{p}^{QP} \right) \left(\omega - \operatorname{Re} \epsilon_{p}^{QP} - \mathrm{i} \left(\eta - \operatorname{Im} \epsilon_{pqv}^{QP} \right) \right)}{\left(\omega - \operatorname{Re} \epsilon_{pqv}^{\mathrm{sat}} + \mathrm{i} \operatorname{Im} Z_{pqv}^{\mathrm{sat}} \right) \left(\omega - \operatorname{Re} \epsilon_{pqv}^{\mathrm{sat}} - \mathrm{i} \left(\eta - \operatorname{Im} \epsilon_{pqv}^{\mathrm{sat}} \right) \right)} \right] \\ &= -\frac{1}{\pi} \left[\frac{\left(\operatorname{Re} Z_{p}^{QP} \right) \left(\operatorname{Im} \epsilon_{p}^{QP} \right) + \left(\operatorname{Im} Z_{p}^{QP} \right) \left(\omega - \operatorname{Re} \epsilon_{p}^{QP} \right)}{\left(\omega - \operatorname{Re} \epsilon_{pqv}^{\mathrm{sat}} \right) + \left(\operatorname{Im} Z_{pqv}^{\mathrm{sat}} \right) \left(\operatorname{Im} \epsilon_{pqv}^{\mathrm{sat}} \right)} \right]} \right] \\ &= -\frac{1}{\pi} \left[\frac{\left(\operatorname{Re} Z_{p}^{QP} \right) \left(\operatorname{Im} \epsilon_{p}^{QP} \right) + \left(\operatorname{Im} Z_{p}^{QP} \right) \left(\omega - \operatorname{Re} \epsilon_{pqv}^{\mathrm{sat}} \right)}{\left(\omega - \operatorname{Re} \epsilon_{pqv}^{\mathrm{sat}} \right)^{2} + \left(\operatorname{Im} \epsilon_{pqv}^{\mathrm{sat}} \right)} \right]} \right] \\ &= -\frac{1}{\pi} \left[\frac{\left(\operatorname{Re} Z_{p}^{QP} \right) \left(\operatorname{Im} \epsilon_{p}^{QP} \right) + \left(\operatorname{Im} Z_{p}^{QP} \right) \left(\omega - \operatorname{Re} \epsilon_{p}^{QP} \right)}{\left(\omega - \operatorname{Re} \epsilon_{pqv}^{\mathrm{sat}} \right)^{2} + \left(\operatorname{Im} \epsilon_{pqv}^{\mathrm{sat}} \right)} \left(\operatorname{Im} \epsilon_{pqv}^{\mathrm{sat}} \right)^{2} + \left(\operatorname{Im} \epsilon_{pqv}^{\mathrm{sat}} \right)^{2}} \right] \right] \\ &= -\frac{1}{\pi} \left[\frac{\left(\operatorname{Re} Z_{p}^{QP} \right) \left(\operatorname{Im} \epsilon_{p}^{QP} \right) + \left(\operatorname{Im} Z_{p}^{QP} \right) \left(\omega - \operatorname{Re} \epsilon_{p}^{QP} \right)}{\left(\omega - \operatorname{Re} \epsilon_{pqv}^{\mathrm{sat}} \right)^{2} + \left(\operatorname{Im} \epsilon_{pqv}^{\mathrm{sat}} \right)^{2}} \right] \right] \\ &= -\frac{1}{\pi} \left[\frac{\left(\operatorname{Re} Z_{p}^{QP} \right) \left(\operatorname{Im} \epsilon_{p}^{QP} \right) + \left(\operatorname{Im} \epsilon_{p}^{QP} \right) \left(\omega - \operatorname{Re} \epsilon_{p}^{\mathrm{sat}} \right)}{\left(\omega - \operatorname{Re} \epsilon_{pqv}^{\mathrm{sat}} \right)^{2} + \left(\operatorname{Im} \epsilon_{pqv}^{\mathrm{sat}} \right)^{2}} \right] \right]$$
