Outline

1. GW Supermatrices

2. RPA via Equation of Motion

3. BSE

4. Ideas of what to look at next

Patryk Kozlowski Sides for Patryk S Notes July 28, 2025

Booth GW Supermatrix

$$m{H}^{G_0W_0} = egin{pmatrix} m{F} & m{W}^< & m{W}^> \ m{W}^{\dagger <} & m{d}^< & m{0} \ m{W}^{\dagger >} & m{0} & m{d}^> \end{pmatrix}$$

where \boldsymbol{F} is the Fock matrix, $\boldsymbol{W}^{<}$ and $\boldsymbol{W}^{>}$ are the lesser and greater components of the RPA screened Coulomb interaction, defined as

$$W_{pk\nu}^{<} = \sum_{ia} (pk|ia) (X_{ia}^{\nu} + Y_{ia}^{\nu}) \quad \text{and} \quad W_{pc\nu}^{>} = \sum_{ia} (pc|ia) (X_{ia}^{\nu} + Y_{ia}^{\nu})$$
(2)

and the auxiliary blocks $d^{<}$ and $d^{>}$ are defined as

$$d_{k\nu,l\nu'}^{<} = (\epsilon_k - \Omega_{\nu}) \, \delta_{k,l} \delta_{\nu,\nu'} \quad \text{and} \quad d_{c\nu,d\nu'}^{>} = (\epsilon_c + \Omega_{\nu}) \, \delta_{c,d} \delta_{\nu,\nu'}$$
 (3)

Garnet GW via auxiliary bosons

They used a basis of particle-hole excitations, approximated as bosons. So $\hat{a}_a^\dagger \hat{a}_i \approx \hat{b}_\nu^\dagger$ and $\hat{a}_i^\dagger \hat{a}_a \approx \hat{b}_\nu$ Define

$$\hat{H}^{\mathrm{eB}} = \hat{H}^{\mathrm{e}} + \hat{H}^{\mathrm{B}} + \hat{V}^{\mathrm{eB}} \tag{4}$$

where \hat{H}^{e} is the electronic Hamiltonian, \hat{H}^{B} is the bosonic Hamiltonian, and \hat{V}^{eB} is the electron-boson coupling term, given as

$$\hat{H}^e = \sum_{pq} f_{pq} \left\{ \hat{a}_p^{\dagger} \hat{a}_q \right\} \tag{5}$$

$$\hat{H}^{B} = \sum_{\nu\mu} A_{\nu\mu} \hat{b}_{\nu}^{\dagger} \hat{b}_{\mu} + \frac{1}{2} \sum_{\nu\mu} B_{\nu\mu} \left(\hat{b}_{\nu}^{\dagger} \hat{b}_{\mu}^{\dagger} + \hat{b}_{\nu} \hat{b}_{\mu} \right) \tag{6}$$

$$\hat{V}^{eB} = \sum_{pq,\nu} V_{pq\nu} \left\{ \hat{a}_p^{\dagger} \hat{a}_q \right\} \left(\hat{b}_{\nu}^{\dagger} + \hat{b}_{\nu} \right) \tag{7}$$

Patryk Kozlowski Slides for Parryk's Nates July 28, 2025 4/17

Form in bosonic basis

Originally \hat{H}^{B} in the bosonic basis was

$$\hat{H}^{B}\left(\hat{b},\hat{b}^{\dagger}\right) = -\frac{1}{2}\operatorname{tr}\mathbf{A} + \frac{1}{2}\begin{pmatrix}\mathbf{b}^{\dagger}&\mathbf{b}\end{pmatrix}\begin{pmatrix}\mathbf{A}&\mathbf{B}\\\mathbf{B}&\mathbf{A}\end{pmatrix}\begin{pmatrix}\mathbf{b}\\\mathbf{b}^{\dagger}\end{pmatrix} \tag{8}$$

$$= \sum_{\nu\mu} A_{\nu\mu} \hat{b}^{\dagger}_{\nu} \hat{b}_{\mu} + \frac{1}{2} \sum_{\nu\mu} B_{\nu\mu} \left(\hat{b}^{\dagger}_{\nu} \hat{b}^{\dagger}_{\mu} + \hat{b}_{\nu} \hat{b}_{\mu} \right) \tag{9}$$

But if we redefine the basis via a Bogoliubov transformation

$$\begin{pmatrix} \overline{\mathbf{b}} \\ \overline{\mathbf{b}}^{\dagger} \end{pmatrix} = \begin{pmatrix} \mathbf{X} & -\mathbf{Y} \\ -\mathbf{Y} & \mathbf{X} \end{pmatrix}^{T} \begin{pmatrix} \mathbf{b} \\ \mathbf{b}^{\dagger} \end{pmatrix} \tag{10}$$

Patryk Kozlowski July 28, 2025

Effect of transformation on Hamiltonians

Then

$$\hat{\mathcal{H}}^{\mathrm{B}}\left(\overline{\mathbf{b}},\overline{\mathbf{b}}^{\dagger}\right) = -\frac{1}{2}\operatorname{tr}\mathbf{A} + \frac{1}{2}\begin{pmatrix}\overline{\mathbf{b}}^{\dagger}\overline{\mathbf{b}}\end{pmatrix}\begin{pmatrix}\Omega\mathbf{1} & 0\\ 0 & \Omega\mathbf{1}\end{pmatrix}\begin{pmatrix}\overline{\overline{\mathbf{b}}}\\\overline{\mathbf{b}}^{\dagger}\end{pmatrix} \tag{11}$$

$$= \sum \Omega_{\nu} \overline{b}_{\nu}^{\dagger} \overline{b}_{\nu} + E_{\text{RPA}}^{c} \tag{12}$$

(13)

Because
$$\hat{b}_{
u}+\hat{b}_{
u}^{\dagger}=\sum_{\mu}\left(\mathbf{X}_{\mu}^{
u}+\mathbf{Y}_{\mu}^{
u}\right)\left(\hat{\overline{b}}_{
u}+\hat{\overline{b}}_{
u}^{\dagger}\right)$$
, we also get

$$\hat{V}^{\mathrm{eB}}\left(\overline{\mathbf{b}}, \overline{\mathbf{b}}^{\dagger}\right) = \sum_{pq,\nu} W_{pq,\nu} \left\{ \hat{a}_{p}^{\dagger} \hat{a}_{q} \right\} \left(\overline{b}_{\nu} + \overline{b}_{\nu}^{\dagger}\right) \tag{14}$$

Patryk Kozlowski Slúks for Parryk's Notes July 28, 2025 6/17

Supermatrix construction

We then build the supermatrices **H** and **S** with matrix elements,

$$\begin{split} H_{IJ} &= \langle 0_{\mathrm{F}} 0_{\mathrm{B}} | \left[C_{I}, \left[\tilde{H}^{\mathrm{eB}}, C_{J}^{\dagger} \right] \right] | 0_{\mathrm{F}} 0_{\mathrm{B}} \rangle \\ S_{IJ} &= \langle 0_{\mathrm{F}} 0_{\mathrm{B}} | \left[C_{I}, C_{J}^{\dagger} \right] | 0_{\mathrm{F}} 0_{\mathrm{B}} \rangle \end{split}$$

where
$$\left\{C_{I}^{\dagger}\right\} = \left\{\underbrace{a_{i}}_{1h}, \underbrace{a_{a}}_{1p}, \underbrace{a_{i}b_{\nu}^{\dagger}}_{2h1p}, \underbrace{a_{a}b_{\nu}}_{1p2p}\right\}$$
 and $|0\rangle_{\mathrm{F}}$ and $|0\rangle_{\mathrm{B}}$ are the Fermi

and boson vacuums. Then constructing $-\mathbf{S}^{-1}\mathbf{H}$ yields Booth's ED. Derivation is in my notes. Nothing too complicated, but long due to many Wick contractions.

Patryk Kozlowski July 28, 2025

Realization of the idea

Describe the bosons via an auxiliary basis, scaling linearly with system size.

$$\hat{b}^{\dagger}_{\nu} pprox \sum_{Q}^{N_{\mathrm{AB}}} C^{Q}_{\nu} \hat{b}^{\dagger}_{Q}, \quad \hat{b}_{\nu} pprox \sum_{Q}^{N_{\mathrm{AB}}} C^{Q}_{\nu} \hat{b}_{Q}$$
 (15)

Use RI technique to get the C_{ν}^{Q} coefficients. Define

$$(ia \mid jb) \approx \sum_{l} R_{ia}^{L} R_{jb}^{L} \tag{16}$$

Then
$$C_{\nu}^Q=\sum_{LM}R_{\nu}^L\left[\mathbf{S}^{-1/2}\right]_{LM}P_M^Q$$
 with $S_{LM}=\sum_{\nu}R_{\nu}^LR_{\nu}^M=\sum_{Q}P_L^QE_QP_M^Q$

Patryk Kozlowski July 28, 2025 8 / 17

Realization of the idea continued

- 1. Get the excitation energies Ω and vectors X + Y by solving the symmetrized Casida eigenproblem in $O(N_{AB}^3)$ time
- Recall last week we identified using $\mathbf{T} = \Omega^{\frac{1}{2}} (\mathbf{A} \mathbf{B})^{-\frac{1}{2}} (\mathbf{X} + \mathbf{Y})$ to get excitation vectors as problematic; but that was in a different context and now we have explicit access to Ω and $\mathbf{A} \mathbf{B}$, so we can do this
- 2. Transform the excitation vectors into a screened Coulomb interaction in $O(N_{\text{orb}}^2 N_{\text{AB}}^2)$ time, where $N_{\text{orb}} = O + V$
- 3. Diagonalize the Hamiltonian with a Davidson procedure in $\mathcal{O}\left(\textit{N}_{\text{orb}}^2\;\textit{N}_{\text{AB}}\right)/\mathcal{O}\left(\textit{N}_{\text{orb}}\;\textit{N}_{\text{AB}}^2\right)$ time for each root

Interestingly, their highest scaling step is 2.

Patryk Kozlowski Slidester Parryks Notes July 28, 2025 9 / 17

Equation of motion formalism

Define an oscillator that satisfies

$$[H, O^{\dagger}] = \omega O^{\dagger}, \qquad [H, O] = -\omega O, \qquad [O, O^{\dagger}] = 1$$
 (17)

With the arbitrary operator R we have

$$\langle \phi | [R, [H, O^{\dagger}]] | \phi \rangle = \omega \langle \phi | [R, O^{\dagger}] | \phi \rangle$$
 (18)

$$\langle \phi | [R, [H, O]] | \phi \rangle = -\omega \langle \phi | [R, O] | \phi \rangle \tag{19}$$

10 / 17

$$\implies \langle \phi | \left[R, H, O^{\dagger} \right] | \phi \rangle = \omega \langle \phi | \left[R, O^{\dagger} \right] | \phi \rangle \tag{20}$$

where we have defined the double commutator as

$$2\left[R,H,O^{\dagger}\right] = \left[R,\left[H,O^{\dagger}\right]\right] + \left[\left[R,H\right],O^{\dagger}\right] \tag{21}$$

This approach can save because we exploit Hermiticity and the commutator is of lower-rank than the product, so we don't need to know much about the wavefunction to get good matrix elements.

Patryk Kozlowski Slides for Patryk's Notes July 28, 2025

The particle hole approximation leads to RPA

Define the excitation operator $\hat{O}^{\dagger} = \sum_{ai} (Y_{ai} \, a_a^{\dagger} a_i - Z_{ia} \, a_i^{\dagger} a_a)$. Then,

$$A_{ai,bj} = \langle \phi | [a_i^{\dagger} a_a, H, a_b^{\dagger} a_j] | \phi \rangle$$
 (22)

$$B_{ai,bj} = -\langle \phi | \left[a_i^{\dagger} a_a, H, a_j^{\dagger} a_b \right] | \phi \rangle \tag{23}$$

$$U_{ai,bj} = \langle \phi | \left[a_i^{\dagger} a_a, a_b^{\dagger} a_j \right] | \phi \rangle \tag{24}$$

or in matrix form

$$\begin{pmatrix} A & B \\ B^{\dagger} & A^* \end{pmatrix} \begin{pmatrix} Y \\ Z \end{pmatrix} = \omega \begin{pmatrix} U & 0 \\ 0 & -U^* \end{pmatrix} \begin{pmatrix} Y \\ Z \end{pmatrix}. \tag{25}$$

Then if we choose the basis that diagonalizes the single-particle Hamiltonian, we get the RPA equations

$$A_{aibj} = \langle 0_{\rm F} | a_{\rm a}^{\dagger} \left[H, a_{\rm b}^{\dagger} a_{i} \right] | 0_{\rm F} \rangle = \delta_{ab} \delta_{ij} \left(\varepsilon_{i} - \varepsilon_{\rm a} \right) + V_{ajib}$$
 (26)

$$B_{aibj} = \langle 0_{\rm F} | a_a^{\dagger} \left[H, a_b a_i^{\dagger} \right] | 0_{\rm F} \rangle = V_{abij} \tag{27}$$

$$U_{aibj} = \langle 0_{\rm F} | a_a^{\dagger} [H, a_b a_i] | 0_{\rm F} \rangle = \delta_{ab} \delta_{ij}. \tag{28}$$

Patryk Kozlowski Slides for Patryk's Notes July 28, 2025

The BSE problem

We want to solve the problem

$$\mathbf{L}^{-1} = \mathbf{L}_0^{-1} - \mathbf{\Xi}^{\text{eh}} \tag{29}$$

$$\implies \begin{pmatrix} \mathcal{A}(\omega) & \mathcal{B}(\omega) \\ \mathcal{B}(\omega) & \mathcal{A}(\omega) \end{pmatrix} \begin{pmatrix} \mathbf{X}^m \\ \mathbf{Y}^m \end{pmatrix} = \Omega^m \begin{pmatrix} \mathbf{X}^m \\ \mathbf{Y}^m \end{pmatrix}$$
(30)

with

$$\mathcal{A}_{\mu\nu} \equiv \mathcal{A}_{ai,bj} = \underbrace{\left(\epsilon_{a}^{QP} - \epsilon_{i}^{QP}\right)\delta_{ab}\delta_{ij} + \left(ai|jb\right)}_{\tilde{A}_{ai,bi}} - \Xi_{ab,ji}(\omega) \tag{31}$$

$$\mathcal{B}_{\mu\nu} \equiv \mathcal{B}_{ai,bj} = (ai|bj) - \Xi_{bi|aj}(\omega) \tag{32}$$

BSE@GW approximates the kernel as the screened Coulomb interaction

$$\Xi(\omega) \approx \Xi_{GW}(\omega) = W(\omega)$$
 (33)

Common to do $\Xi_{GW}(\omega) \approx W(\omega = 0)$, which introduces errors

Patryk Kozlowski Slides for Parryk's Notes July 28, 2025 12 / 17

Tim's full frequency and frequency free BSE@TDA

In TDA, the upfolded 2p Hamiltonian is given by

$$\mathcal{H} = \begin{pmatrix} \tilde{\mathbf{A}} & -\mathbf{V}^{e} & -\mathbf{V}^{h} \\ (\mathbf{V}^{h})^{\dagger} & \mathbf{D} & \mathbf{0} \\ (\mathbf{V}^{e})^{\dagger} & \mathbf{0} & \mathbf{D} \end{pmatrix}$$
(34)

The single excitation block \tilde{A} was defined last slide; the rest is:

$$D_{iajb,iajb} = [-E_{occ}] \oplus_{kron} E_{vir} \oplus_{kron} S$$
(35)

$$V_{ia,ldkc}^{h} = \sqrt{2} \left(il|kc \right) \delta_{ad} \tag{36}$$

$$V_{ia,ldkc}^{e} = \sqrt{2} \left(kc | ad \right) \delta_{il} \tag{37}$$

13 / 17

Here, **S** is the direct RPA matrix in the TDA. Claim: this downfolds to 31, thus preserving full frequency dependence; I have not been able to prove this yet.

Patryk Kozlowski Sliles for Patryk's Notes July 28, 2025

Where I am stuck in the derivation

$$\mathcal{A}(\omega) = \tilde{\mathbf{A}} - \mathbf{V}^{e}(\omega \mathbf{I} - \mathbf{D})^{-1}(\mathbf{V}^{h})^{\dagger} - \mathbf{V}^{h}(\omega \mathbf{I} - \mathbf{D})^{-1}(\mathbf{V}^{e})^{\dagger}$$
(38)

This implies the kernel shoulld be

$$K_{abij}^{(p)}(\omega) = \mathbf{V}^{e}(\omega \mathbf{I} - \mathbf{D})^{-1}(\mathbf{V}^{h})^{\dagger} + \mathbf{V}^{h}(\omega \mathbf{I} - \mathbf{D})^{-1}(\mathbf{V}^{e})^{\dagger}$$
(40)

$$= \frac{\mathbf{V}^{e} \tilde{\mathbf{X}} (\mathbf{V}^{h} \tilde{\mathbf{X}})^{\dagger}}{\omega \mathbf{I} - (-\mathbf{E}_{O} \oplus \mathbf{E}_{V} \oplus \Omega_{OV})} + \frac{\mathbf{V}^{h} \tilde{\mathbf{X}} (\mathbf{V}^{e} \tilde{\mathbf{X}})^{\dagger}}{\omega \mathbf{I} - (-\mathbf{E}_{O} \oplus \mathbf{E}_{V} \oplus \Omega_{OV})}$$
(41)

I should be getting

$$K_{abij}^{(p)}(\omega) = 2\sum_{m}^{\Omega_{m}>0} (ij|\rho_{m}) \left(ab|\rho_{m}\right) \left[\frac{1}{\omega - (E_{b} - E_{i}) - \Omega_{m}} + \frac{1}{\omega - (E_{a} - E_{j}) - \Omega_{m}}\right]$$

$$\tag{43}$$

where $(pq|\rho_m) = \sum_{ia} X_{ia}^m(pq|ia)$.

(口) (國) (基) (基) (基)

Patryk Kozlowski

Starting from QRPA

If ground state $|\phi\rangle$ is the quasiparticle vacuum

$$|\tilde{\phi}\rangle = \prod_{\nu>0} \left(U_{\nu} + V_{\nu} a_{\nu}^{\dagger} a_{\overline{\nu}}^{\dagger} \right) |-\rangle \tag{44}$$

with quasiparticles (satisfying $U_{\nu}^2 + V_{\nu}^2 = 1$) defined by:

$$\alpha_{\nu}^{\dagger} = U_{\nu} a_{\nu}^{\dagger} - V_{\nu} a_{\bar{\nu}} \tag{45}$$

$$\alpha_{\bar{\nu}}^{\dagger} = U_{\nu} a_{\bar{\nu}}^{\dagger} + V_{\nu} a_{\nu} \tag{46}$$

Then $\alpha_{
u}|\tilde{\phi}\rangle=0$

Patryk Kozlowski Slides for Patryk's Notes July 28, 2025 15 / 17

Starting from QRPA continued

Define excitation vector as

$$O^{\dagger} = \sum_{\mu\nu} \left(Y_{\mu\nu} \alpha_{\mu}^{\dagger} \alpha_{\nu}^{\dagger} + Z_{\mu\nu} \alpha_{\mu} \alpha_{\nu} \right) \tag{47}$$

Then

$$A_{\mu\nu\mu'\nu'} = \langle \phi | \left[\alpha_{\nu}\alpha_{\mu}, H, \alpha_{\mu'}^{\dagger} \alpha_{\nu'}^{\dagger} \right] | \phi \rangle, \tag{48}$$

$$B_{\mu\nu\mu'\nu'} = \langle \phi | \left[\alpha_{\nu}\alpha_{\mu}, H, \alpha_{\mu'}\alpha_{\nu'} \right] | \phi \rangle, \tag{49}$$

$$U_{\mu\nu\mu'\nu'} = \langle \phi | \left[\alpha_{\nu}\alpha_{\mu}, \alpha_{\mu'}^{\dagger} \alpha_{\nu'}^{\dagger} \right] | \phi \rangle.$$
 (50)

Patryk Kozlowski July 28, 2025 16 / 17

Form of HeB

Define

$$\hat{\mathcal{H}}^{\mathrm{eB}} = \hat{\mathcal{H}}^{\mathrm{e}} + \hat{\mathcal{H}}^{\mathrm{B}} + \hat{\mathcal{V}}^{\mathrm{eB}} \tag{51}$$

where \hat{H}^{e} is the electronic Hamiltonian, \hat{H}^{B} is the bosonic Hamiltonian, and \hat{V}^{eB} is the electron-boson coupling term, given as

$$\hat{H}^e = \sum_{pq} f_{pq} \left\{ \hat{a}_p^{\dagger} \hat{a}_q \right\} \tag{52}$$

$$\hat{H}^{B} = \sum_{\nu\mu} A_{\nu\mu} \hat{b}_{\nu}^{\dagger} \hat{b}_{\mu} + \frac{1}{2} \sum_{\nu\mu} B_{\nu\mu} \left(\hat{b}_{\nu}^{\dagger} \hat{b}_{\mu}^{\dagger} + \hat{b}_{\nu} \hat{b}_{\mu} \right)$$
 (53)

$$\hat{V}^{eB} = \sum_{pq,\nu} V_{pq\nu} \left\{ \hat{a}_p^{\dagger} \hat{a}_q \right\} \left(\hat{b}_{\nu}^{\dagger} + \hat{b}_{\nu} \right) \tag{54}$$

Patryk Kozlowski Slides for Pauryk's Notes July 28, 2025 17 / 17
